

Tropical Pacific Observing System-2020 Project

David M Legler

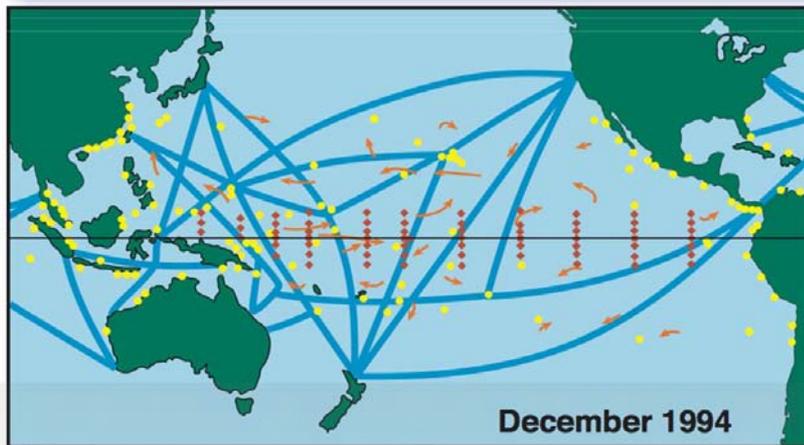

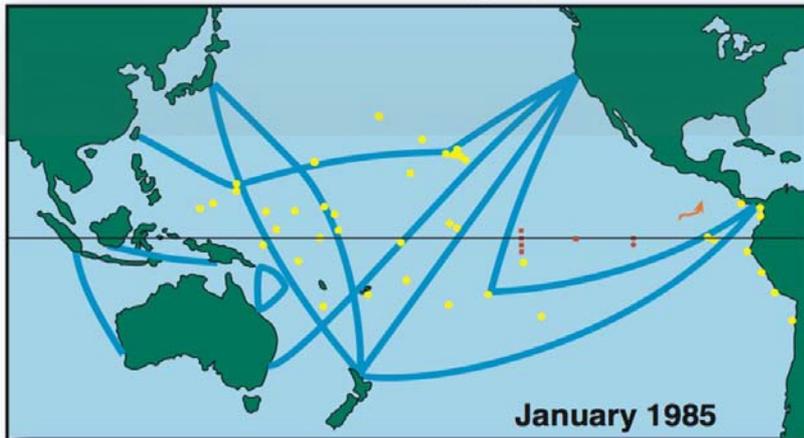

Climate Program Office/Climate Observation Division

NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

September 25, 2014

TOGA Observing System

The ENSO observing system

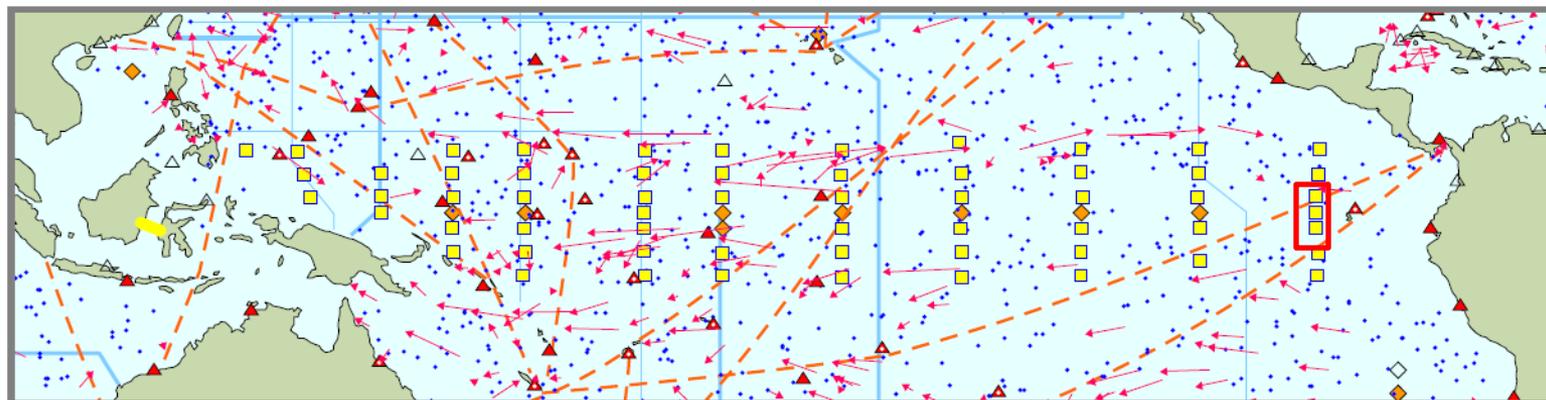

Designed during the Tropical Oceans Global Atmosphere Experiment (TOGA*), 1985-1994.

- TAO developed with support from US, Japan, France, Korea, Taiwan
- TAO → TAO/TRITON in 2000: a NOAA/JAMSTEC partnership
- TAO transferred to operational environment beginning in 2005

Tropical Pacific Ocean Observing

Satellite observations:

- SST
- SSH
- ocean colour
- surface vector wind
- surface salinity

In situ observing networks:

- Volunteer observing ships
- Surface drifters
- Tide gauges
- XBT transects
- Argo profiling floats
- Repeat hydrography
- Tropical moored array
- Time series sites
- Emerging technologies

TPOS Issues and Risks

- Challenges sustaining the TAO/TRITON Mooring Array.
- Risks are not being actively monitored and assessed
 - Need to spread risk
- Requirements and applications have evolved since TOGA
 - Increased focus on biogeochemical and biological systems
 - Multi-disciplinary approaches
- Modeling and observing technology have evolved
 - Argo, ALT, ensembles, reanalysis, ...
- Timely for a systems-based evaluation of the requirements, implementation and delivery of observations
 - Across all elements of the OS

Impetus for Change

Tropical Pacific Observing System (TPOS) Workshop January 2014

KEY RECOMMENDATION

The creation of a focussed
TPOS 2020 Project
to achieve the transition from a loosely coordinated set of
ocean observing activities in the tropical Pacific to a
systematic and sustained TPOS by 2020.

Inevitably, research and new technology will be a central
part of the change

Tropical Pacific Observing System 2020 Goals

TPOS Workshop January 2014

- To monitor, observe, define the state of ENSO, and improve scientific understanding;
- To support observation and prediction systems for ocean and weather and climate services, including underpinning research;
- Advance/refine knowledge of tropical Pacific predictability (physical and biogeochemical) and its climate impacts; and
- To relate ocean/climate variability and change to marine biogeochemistry and biology and carbon budgets, food security and biodiversity

Increased
international
support

Evolving the
observing system

More effective and
strategic
coordination/planning

Reinforcing key priorities:

- Identify and sustain critical long climate records as a priority.
- Unique contribution of TAO/TRITON long time series recognized
- Maintain and improve broad scale sampling, taking into account all observing networks.
- Encourage integration of Biogeochemistry and Biology

Identifying new requirements

- Observing Eastern, Western, Equatorial Boundary Regions.
- Observing Diurnal Variability, Air Sea Fluxes.

Strengthening connection to modelling.

- Multisystem analysis activities, observing system design, targeted process studies.

Integration: Complementarity between satellites and in-situ observing systems (altimetry, SST, winds)

- Satellites provide spatial coverage and detail
- High-freq mooring data help de-alias diurnal signal in satellite data
- In-situ data used in satellite cal/val
- Blended products deliver higher-level value-added products

Urgent Actions for TPOS

- **Strongly endorsed** NOAA's offer to return TAO to 80% data return.
- **Urgent need** to explore strategies to mitigate the impact of the reduction in the TRITON component of the Array.
- **Communication and coordination** among existing partners need urgent attention.
- **Initiate discussions** to broaden engagement in supporting the TPOS, enabling new partners.
- **Ensure sufficient redundancy** to enable cross platform quality checks, and mitigate the risk of platform bias.

Proposed TPOS 2020 Governance and Project Structure

Completed since Jan 2014

GOOS Steering Committee approved TPOS project

GOOS Steering Committee

TPOS SC Meeting Oct 6-9 at KIOST, S. Korea

TPOS Exec
(chairs of SC, RF + Staffer)

Craig McLean, OAR-AA to lead the TRF.

TPOS Steering Committee

TPOS Resource Forum

Broad-scale Task Team

Diurnal & Fluxes TT

Boundary Regions TT

Models, Forecasts & Data Assimilation TT.

Secretariat
(established short-term)

Focused Task Teams and Pilot Projects, overseen by the TPOS SC. Initial priorities identified here.

Interests in engaging supporting TPOS

Developing TPOS: Broad interest from many organisations

- Substantial engagement from the US, Japan, Republic of Korea, China, Peru, Chile, ...

Step change will require innovation

- Systematic errors must be understood and addressed

Enthusiasm to support change

- Co-Chairs identified and committed
 - Urgency provided motivation
 - Steering Committee identified from pre-eminent scientists in the field
- Project goals and scope agreed by sponsors
 - 2014-2020
 - Daunting but doable
 - Sponsors agreed urgency for change

Key Messages

- Ocean observations from the tropical Pacific are fundamental to understanding, monitoring, ocean and climate forecasts; climate change detection..
- The sustainability of the observing system is at significant risk
- The community was not well prepared for monitoring or mitigating these risks. Needs a broader base.
- Significant change is required
- 20 years on from TOGA it is timely review and reset the observing system, to improve efficiency and respond to new priorities.
- 20 years on, the research-operations partnership need to be examined anew.

Many challenges and opportunities ahead...

Thank You
